

Is ArchiCAD connected to Claude?

A 15-second check — no technical knowledge needed.

If Claude says it can only use a “Linux container” or can’t see your computer:

That just means the ArchiCAD connection didn’t load. This guide runs an automatic check and saves a small report to your Desktop. **Email that report back** and we’ll have it fixed quickly.

First, a 10-second sanity check

Make sure you are using the **installed Claude Desktop app** — a program in its own window — **not** the Claude website in a web browser (Chrome/Edge). The website cannot reach your computer and will always give the “Linux container” message.

Don’t have the app? Install it free from <https://claude.ai/download>, then re-run the installer.

Run the automatic check

- 1 Open PowerShell.** Click the Windows **Start** button, type `powershell`, and press **Enter**. A dark blue window opens. (This is the same window you used to install.)
- 2 Copy the line below** (triple-click it to select, then **Ctrl-C**), click into the blue window, paste with **Ctrl-V**, and press **Enter**.

▸ the one-line check — copy all of it

```
irm https://raw.githubusercontent.com/agmurf/tapir-archicad-MCP/master/diagnos  
e.ps1 | iex
```

- 3 Wait about 15 seconds.** You’ll see a list of checks with **[OK]** or **[PROBLEM]** next to each, and a plain-English summary at the bottom.
- 4 Email the report.** A file named `Architech-Diagnostic-Report.txt` is now on your **Desktop**. Attach it to a reply — that tells us exactly what to fix.

Prefer one click? Use the tool file instead

If copying and pasting feels fiddly, download this small file and **double-click it** — it runs the exact same check:

↓ [Download Diagnose-ArchitechMCP.bat](#)

Windows may show a blue “Windows protected your PC” box because the file is new — click **More info** → **Run anyway**. It only reads your settings and writes the report; it changes nothing.

The two most common fixes

While you wait to hear back, these solve it the vast majority of the time:

- **Fully restart Claude Desktop.** Closing the window isn’t enough — right-click the Claude icon in the system tray (bottom-right of the screen, near the clock) and choose **Quit**, then open it again. The ArchiCAD tools only appear after a full restart.
- **Re-run the installer.** If the first install was interrupted, the connection never finishes setting up. Running the installer again is safe and fixes a half-finished install.

After either fix, open Claude Desktop and ask: *“What MCP tools do you have?”* If it lists ArchiCAD tools, you’re connected — open a project in ArchiCAD and you’re ready to go.
